Hands On Projects

Dappazon

1st

A sample Amazon clone on chain

In the scope of this project I learned much on how to create an Amazon decentralized app where individuals can purchase items directly on chain and same time use ETH to make the purchase. Alongside a backend using Solidity, Hardhat, Ethers.js and Testnets. Not forgetting the security measures to it.

TicketMaster

2nd

Buying tickets online using ETH

TicketMaster is a project which allows individuals to book tickets for an event on chain alongside paying for the specific seat of the event using ETH. In the course of the project I had great knowledge connecting the backend, the frontend and also connectivity to Metamask. Not forgetting proper testing using Hardhat.

Fuacut

3rd

sample crypto faucet

In this project I got more insights on how to create a faucet when individuals can request for test tokens to their network for testing purposes like swapping and bridging on their own end. Also with the use of React it was possible to create a sample front-end interface for it alongside its connectivity to Metamask.

Zillow clone

4th

real estate

Zillow clone is a project which individuals can use to buy real estate on chain and paying with ETH. Not forgetting that sellers can also be able to list their assets on chain for buyers to buy them. In project I learned how to use IPFS for storing images on chain and getting the metadata and how to use this metadata in my code.
